

CLIMATE REPORT

WINTER'S FREEZING FROSTY FORECASTS

By Michael Hines

From *Climate Report*

Winter's forecast is looking cold, according to the latest climate models. The latest forecast from the National Centers for Environmental Prediction (NCEP) shows a strong cold spell across the central and eastern United States starting in late December. The cold air will move southward through January, bringing temperatures below normal across most of the country.

These long-term forecasts are based on computer models that simulate the Earth's climate system. The models take into account various factors such as atmospheric circulation, ocean currents, and greenhouse gas concentrations. They are used to predict future weather patterns and climate trends.

According to the latest forecast, the cold spell will begin in late December and continue through January. The cold air will move southward across the central and eastern United States, bringing temperatures below normal across most of the country. The cold spell will be particularly intense in the central and eastern United States, where temperatures will be well below normal.
