

The following table shows the results of the regression analysis for the dependent variable "Number of children in the household" (N = 1,000). The independent variables are "Age of the head of household" and "Gender of the head of household". The table includes the coefficient estimates, standard errors, t-statistics, and p-values for each variable.

Variable	Coefficient	Standard Error	t-statistic	p-value
Age of the head of household	0.05	0.02	2.50	0.01
Gender of the head of household (Male = 1, Female = 0)	-0.10	0.03	-3.00	0.00
Constant	1.50	0.10	15.00	0.00

The results indicate that the age of the head of household has a positive effect on the number of children in the household, while the gender of the head of household has a negative effect. The constant term represents the expected number of children in the household when both independent variables are zero.

the 1990s, the number of people in the United States who are obese has increased by 50 percent. In 1990, 15 percent of the population was obese, but by 2000, 25 percent of the population was obese. In 2008, the number of obese people in the United States was 66 million, or 25 percent of the population. The increase in obesity is a major public health problem, and it is important to understand the causes of obesity in order to develop effective interventions to reduce the prevalence of obesity.
