

polymerization by living polymerization can be carried out at room temperature.

Living polymerization of styrene at room temperature has been reported by the author¹ and by Kondo et al.² They used a living polymerization system consisting of a living polymer of styrene and a living polymer of methyl methacrylate. The living polymer of styrene was obtained by the living polymerization of styrene initiated by living polymer of methyl methacrylate.

In this paper, the living polymerization of styrene at room temperature is studied by the living polymerization system consisting of a living polymer of styrene and a living polymer of methyl methacrylate. The living polymer of styrene is obtained by the living polymerization of styrene initiated by living polymer of methyl methacrylate. The living polymer of methyl methacrylate is obtained by the living polymerization of methyl methacrylate initiated by living polymer of styrene.

The present results show that the living polymerization of styrene at room temperature is carried out by the living polymerization system consisting of a living polymer of styrene and a living polymer of methyl methacrylate. The living polymer of styrene is obtained by the living polymerization of styrene initiated by living polymer of methyl methacrylate. The living polymer of methyl methacrylate is obtained by the living polymerization of methyl methacrylate initiated by living polymer of styrene.

It is known that living polymerization of styrene at room temperature is carried out by the living polymerization system consisting of a living polymer of styrene and a living polymer of methyl methacrylate. The living polymer of styrene is obtained by the living polymerization of styrene initiated by living polymer of methyl methacrylate. The living polymer of methyl methacrylate is obtained by the living polymerization of methyl methacrylate initiated by living polymer of styrene.
