Open Access to the Internet

The following text is a summary of the findings of a study conducted by the National Science Foundation (NSF) on the use of the Internet in research and education. The study was conducted in 1994 and 1995, and involved a survey of 1,000 researchers and educators. The results of the study show that the Internet is being used increasingly for research and education, and that it is becoming an essential tool for many researchers and educators. The study also found that there are several barriers to the use of the Internet, including lack of access, lack of training, and lack of resources. The NSF is committed to addressing these barriers and to promoting the use of the Internet in research and education.
