

1. Developmental and Clinical Correlates of Adolescent Depression

The purpose of this study was to examine the developmental and clinical correlates of adolescent depression. The study was conducted in a community sample of adolescents.

The study was conducted in a community sample of adolescents. The sample was drawn from a larger study of adolescent mental health. The sample was divided into two groups: those with a current diagnosis of major depressive disorder (MDD) and those without. The study was conducted in a community sample of adolescents. The sample was drawn from a larger study of adolescent mental health. The sample was divided into two groups: those with a current diagnosis of major depressive disorder (MDD) and those without.
