

Afonía de madrugadas

— 2 —

10 of 10

Most likely these results were influenced by the fact that we used a small sample size. It seems likely that there would be more evidence of a relationship at higher concentrations of the metal, which may be due to increased bioavailability of the metal. Further work is required to determine the mechanism(s) by which the metal may affect the activity of the enzyme.

Such an approach would provide only the minimum, making no reference to other "factors" or "variables" which may have been present. This was done here, and appears to indicate no positive relation in past or present time. In this case perhaps all the variables have an equal influence on results. I believe there can hardly be any real-life situation, however, in which one or two factors are dominant.

My grandmother wrote me this fragment. She was very fond of
writing poetry and having several books of poems written. This
one is probably the original, as my mother, Edith, has one that is very
similar. It is handwritten. The first sentence is in her mother's
handwriting. There were a few other parts like this, but they were
written over by Edith. I have tried to keep the original spelling, punctuation,
and grammar, but some were changed so as to make it fit into
the rest of the poem. I hope she enjoyed them. I am sending them
now. Please let me know if you would like me to send more.

Applying this model to the problem of how to evaluate the quality of a single image may lead to principles such as: "Accuracy of the image depends on the quality of the original signal and the quality of the process used to obtain the image".
