

RECENT ADVANCES IN THE TREATMENT OF HIV INFECTION

The recent advances in the treatment of HIV infection have been remarkable. The introduction of zidovudine (ZDV) in 1987, zalcitabine (ZC) in 1989, and zalcitabine (ZC) and zidovudine (ZDV) in combination in 1990, marked the beginning of a new era in the treatment of HIV infection. The combination of ZDV and ZC, known as ZDV/ZC, is the most effective and well-tolerated combination of antiretroviral drugs available at present. The combination of ZDV and ZC is also the most effective and well-tolerated combination of antiretroviral drugs available at present.

The combination of ZDV and ZC is the most effective and well-tolerated combination of antiretroviral drugs available at present. The combination of ZDV and ZC is also the most effective and well-tolerated combination of antiretroviral drugs available at present. The combination of ZDV and ZC is the most effective and well-tolerated combination of antiretroviral drugs available at present.

The combination of ZDV and ZC is the most effective and well-tolerated combination of antiretroviral drugs available at present. The combination of ZDV and ZC is also the most effective and well-tolerated combination of antiretroviral drugs available at present. The combination of ZDV and ZC is the most effective and well-tolerated combination of antiretroviral drugs available at present.

The combination of ZDV and ZC is the most effective and well-tolerated combination of antiretroviral drugs available at present. The combination of ZDV and ZC is also the most effective and well-tolerated combination of antiretroviral drugs available at present. The combination of ZDV and ZC is the most effective and well-tolerated combination of antiretroviral drugs available at present.
