

How Many Children Have an Attention-Deficit/Hyperactivity Disorder?

The issue of how many children have attention-deficit/hyperactivity disorder (ADHD) is controversial. This controversy is based on differences in the criteria used to define the disorder and on differences in the methods used to estimate the prevalence of the disorder.

There are a number of reasons why the prevalence of ADHD is controversial. First, the criteria used to define the disorder are controversial. The criteria used in the Diagnostic and Statistical Manual of Mental Disorders (DSM-IV) are controversial because they are based on a model of the disorder that is based on the idea that the disorder is a disorder of the brain. This model is based on the idea that the disorder is a disorder of the brain because it is a disorder that is caused by a disorder of the brain.

Second, the methods used to estimate the prevalence of ADHD are controversial. The methods used in the DSM-IV are controversial because they are based on a model of the disorder that is based on the idea that the disorder is a disorder of the brain. This model is based on the idea that the disorder is a disorder of the brain because it is a disorder that is caused by a disorder of the brain.

As the controversy about the prevalence of ADHD continues, it is important to remember that the prevalence of the disorder is not the same as the prevalence of the disorder in a specific population. The prevalence of the disorder in a specific population is the number of children who have the disorder in that population. The prevalence of the disorder in a specific population is not the same as the prevalence of the disorder in the entire population. The prevalence of the disorder in a specific population is not the same as the prevalence of the disorder in the entire population because the prevalence of the disorder in a specific population is based on the number of children who have the disorder in that population, while the prevalence of the disorder in the entire population is based on the number of children who have the disorder in the entire population.

There are a number of reasons why the prevalence of ADHD is controversial. First, the criteria used to define the disorder are controversial. The criteria used in the DSM-IV are controversial because they are based on a model of the disorder that is based on the idea that the disorder is a disorder of the brain. This model is based on the idea that the disorder is a disorder of the brain because it is a disorder that is caused by a disorder of the brain.
