

The program was begun in 1971 and has
 since then been continuously developing.
 At first the focus was on the development
 of a system for monitoring the quality of
 the water in the river. This was done by
 installing a network of sensors along the
 river. The data collected was then used to
 develop a model of the river's flow and
 to predict the impact of various factors
 on the water quality. This model was then
 used to develop a system for controlling
 the flow of water in the river. This system
 was then used to develop a system for
 controlling the flow of water in the river.
