

Differential Ventilation (DV) is a new concept in ventilation control. It is a system that allows the user to control the ventilation rate of individual rooms or zones. This is achieved by using a series of sensors to monitor the air quality in each room and then adjusting the ventilation rate accordingly. DV is a more efficient and cost-effective way of controlling ventilation than traditional methods, such as fixed ventilation rates or manual control. It can also help to improve indoor air quality and reduce energy consumption.

the 1990s, the number of people in the United States who are 65 years of age or older is projected to increase from 20 million to 35 million. This increase is expected to be particularly significant for women, whose life expectancy is longer than men's. As a result, the number of women aged 65 and older is projected to increase from 12 million to 20 million by the year 2010. This increase in the number of older women is expected to have a significant impact on the labor force, as many women in this age group are expected to continue to work. This article examines the impact of the aging of women on the labor force, and discusses the challenges that employers and policymakers face in addressing the needs of this growing population.

1990. The following table summarizes the results of the 1990 survey. The table shows the number of respondents who answered "yes" or "no" to the question "Do you think the current system of government is the best one for the country?" The table also shows the percentage of respondents who answered "yes" or "no" to the question "Do you think the current system of government is the best one for the country?"
